Question#1:

- Part A:

Added one more jobber in the system. Also added a new tool to be used by the jobber i.e.: DRILL. Now hard task can be done with either a HAMMER or a DRILL but introduced a new HARD_WORK which can only be done with the help of drill. The characteristics are same i.e.: once a tool has been acquired, it can't be used until put back by one jobber.

Project

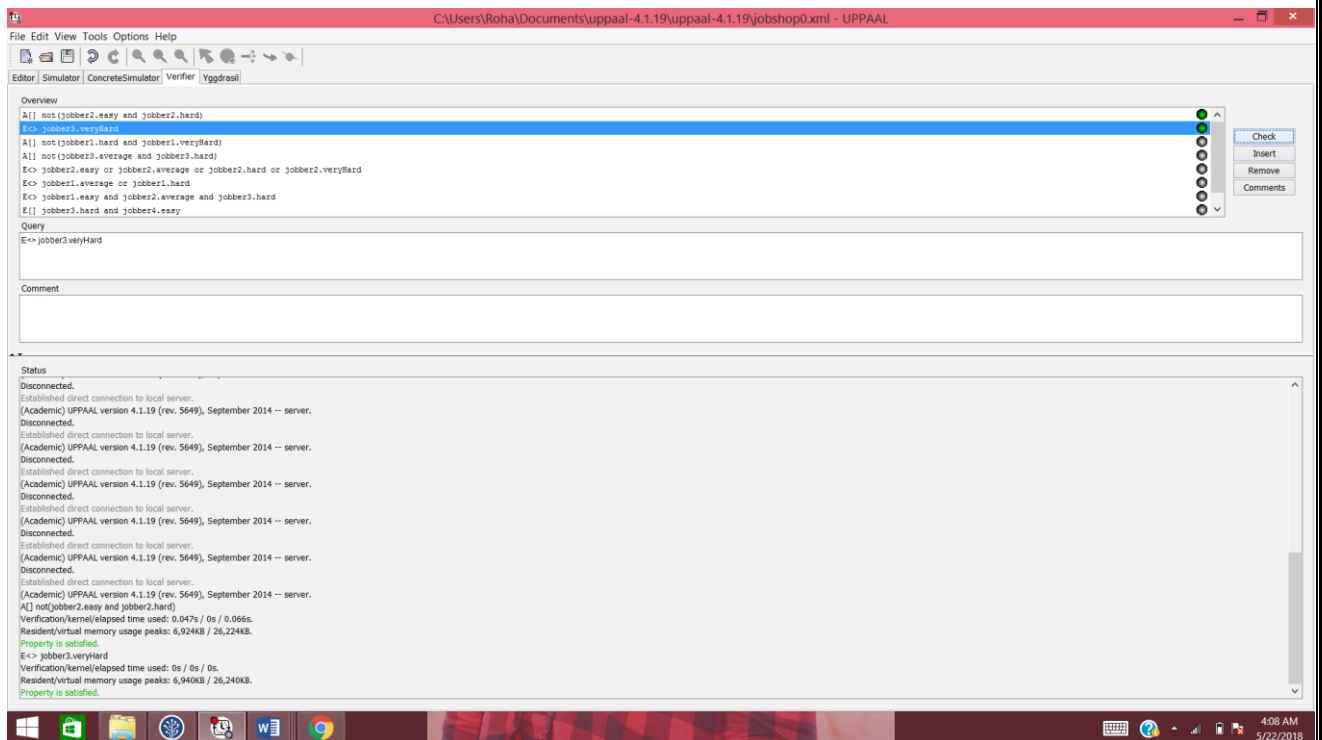

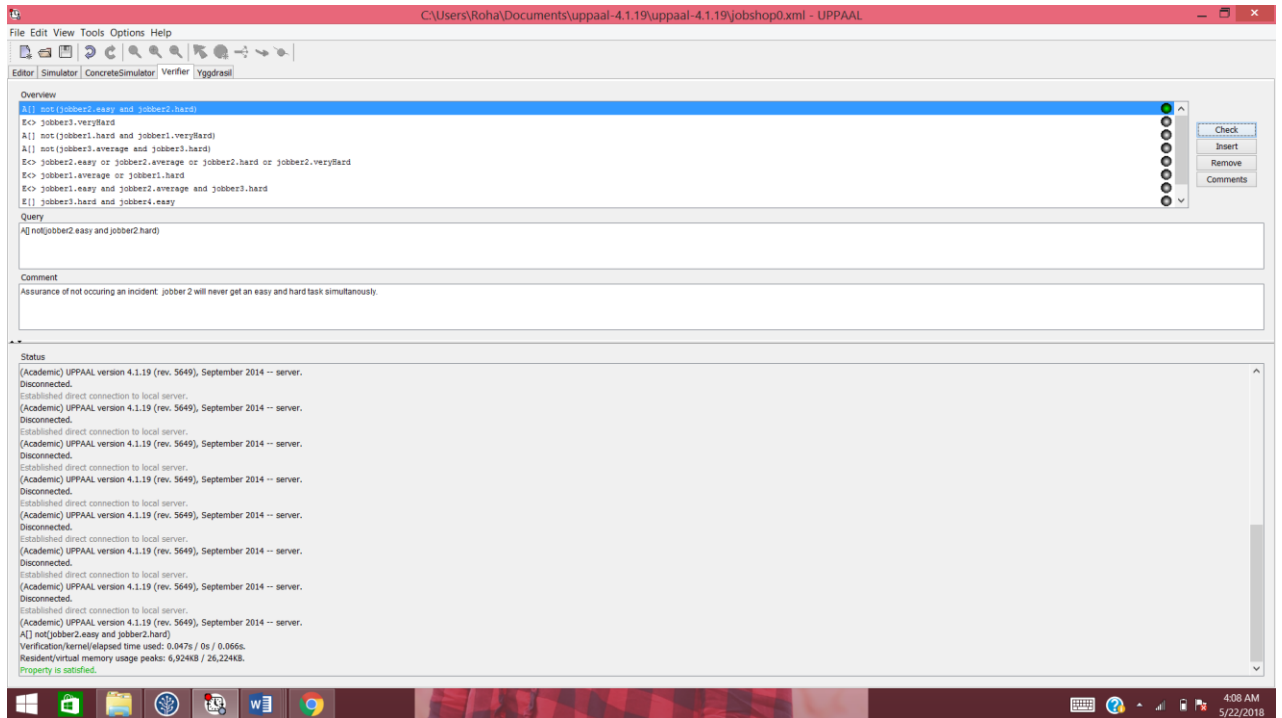

- Declarations
- jobber
- drill
- hammer
- mallet
- System declarations

```
// Place template instantiations here.
jobber1 = jobber();
jobber2 = jobber();
jobber3 = jobber();
jobber4 = jobber();

// List one or more processes to be composed into a system.
system jobber1, jobber2, jobber3, hammer, mallet, drill;

//done by Roha Asad , BESE-6B
```

Following properties have been added and verified in UPPAAL.

Question#2:

Traffic light system has been designed to manage traffic issues at NUST, Kashmir Highway, G11 signal and Zero-point. A timer has been set to maintain the current light at signal. A function has been created CHANGE() which will manage the change of control between traffic lights at each place. CENTRE has been created which has attributes to be released or acquired.

Following is the system:

Properties:

C:\U

File Edit View Tools Options Help

Editor Simulator ConcreteSimulator Verifier Yggdrasil

Overview

```

E<> T1.Green
A[] not(T1.Green and T2.Green and T3.Green and T4.Green)
A[] not(T1.Green)
A[] (T1.Red and T2.Red and T3.Red and T4.Red)
E<>T4.Green
E<>T3.Green
E<> T2.Green
    
```

Query

```

E<> T1.Green
    
```

A. Mutex Property:

Mutex Property means all signals can't have same light e.g: GREEN at same time. So the system must satisfy this.

Query

```
A[] not(T1.Green and T2.Green and T3.Green and T4.Green)
```

Comment

```
Property is satisfied.  
A[] not(T1.Green and T2.Green and T3.Green and T4.Green)  
Verification/kernel/elapsed time used: 0.016s / 0s / 0.016s.  
Resident/virtual memory usage peaks: 6,576KB / 25,400KB.  
Property is satisfied.
```

B. Bounded Liveness:

This property means that there will exist a time in future when the following condition will be true. i.e.: T1 will be green or T2 will be green. It must be satisfied.

Query

```
E<> T1.Green
```

```
E<>T4.Green  
E<>T3.Green  
E<> T2.Green
```

```
Property is satisfied.  
E<> T1.Green  
Verification/kernel/elapsed time used: 0s / 0s / 0s.  
Resident/virtual memory usage peaks: 6,576KB / 25,400KB.  
Property is satisfied.  
E<> T2.Green  
Verification/kernel/elapsed time used: 0s / 0s / 0s.  
Resident/virtual memory usage peaks: 6,576KB / 25,400KB.  
Property is satisfied.  
E<>T3.Green  
Verification/kernel/elapsed time used: 0s / 0s / 0s.  
Resident/virtual memory usage peaks: 6,576KB / 25,400KB.  
Property is satisfied.  
E<>T4.Green  
Verification/kernel/elapsed time used: 0s / 0s / 0s.  
Resident/virtual memory usage peaks: 6,576KB / 25,400KB.  
Property is satisfied.
```

C. Deadlock Avoidance:

Deadlock must not happen which means all the traffic signal lights can't be RED at one time. One or more will be at YELLOW or GREEN as well. This property and condition must not satisfy.

```
A[] (T1.Green and T2.Green and T3.Green and T4.Green)
```

```
A[] (T1.Red and T2.Red and T3.Red and T4.Red)
```

Property is satisfied.

```
A[] (T1.Red and T2.Red and T3.Red and T4.Red)
```

Verification/kernel/elapsed time used: 0s / 0s / 0s.

Resident/virtual memory usage peaks: 6,576KB / 25,400KB.

Property is not satisfied.

```
A[] (T1.Green and T2.Green and T3.Green and T4.Green)
```

Verification/kernel/elapsed time used: 0s / 0s / 0s.

Resident/virtual memory usage peaks: 6,576KB / 25,400KB.

Property is not satisfied.

The screenshot shows a Facebook group page for 'Formal Methods BESE6'. The page is viewed by a user named Roha. The group is a 'Closed Group' and has a 'Discussion' tab selected. The left sidebar shows group details and a list of members. The main content area shows a post by Roha Qureshi from April 1, titled 'Deterministic Finite Automaton:'. The post lists 12 topics: 1. Locks, 2. Clock, 3. Games with discrete squares and pieces, 4. Vending Machines, 5. AI in Video Games: Pac-Man's Ghosts, 6. Internet Protocols: TCP as a DFA, 7. Traffic Lights, 8. Speech Recognition, 9. Regular Expression Matching, 10. CPU Controllers, 11. Natural Language Processing, 12. Text parsing. Below the list, the post discusses 'Pushdown Automaton' and 'Modern PCs as Turing Machines'. The right sidebar shows recommendations for 'Ketogenic Diet Pa' and 'Cat Care Service'. The bottom of the page shows a Windows taskbar with various application icons.

Roha Qureshi

April 1

Deterministic Finite Automaton:

1. Locks: A typical keyed lock has a finite set of pins that if the key matches, allow the lock to be turned.
2. Clock, Specially the ones which ticks.
3. Games with discrete squares and pieces, e.g. chess, go, monopoly, chutes and ladders etc.
4. Vending Machines
5. AI in Video Games: Pac-Man's Ghosts
6. Internet Protocols: TCP as a DFA
7. Traffic Lights
8. Speech Recognition
9. Regular Expression Matching
10. CPU Controllers
11. Natural Language Processing
12. Text parsing

Pushdown Automaton:

1. Parser for programming languages.
2. Evaluation of mathematical expressions in smartphone calculator.
3. Tokenization of program in some programming language, maintaining a stack to match left and right braces.
4. Online Transaction process system.
5. Tower of Hanoi (Recursive Solution).
6. Compiler design(parser design for syntactic analysis).

Modern PCs as Turing Machines:

A modern computer has not only registers, RAM and storage that are directly analogous to UTM tape, but also the IO and human interaction devices that can provide some kind of almost unlimited "tapes", but not an infinite amount of it, that's for sure. And the presence of multiple tapes mean nothing for a TM, as a multi-tape TM can be simulated and can simulate a single-tape TM.

--> TM's typically are specified without I/O -- the input is what is on the tape when the machine is turned on, and the output is whatever is on the tape when the machine halts. There is no provision in standard TM descriptions

--> TM's typically are specified without I/O -- the input is what is on the tape when the machine is turned on, and the output is whatever is on the tape when the machine halts. There is no provision in standard TM descriptions to change the machine state externally, or read the machine state externally, while the machine is running. Modern day computers use I/O all the time.

--> Turing Machines have unbounded storage, modern day computers don't. So we can safely say that a modern computer is effectively an optimized, finite and usable real-world implementation of a Turing Machine.

What if we do not consider Turing Machine?

--> Modern day computers have all the inspiration of computation from Turing Machines. If we don't consider Turing Machines, then We'll not be having RANDOM ACCESS PHENOMENON in our devices rather sequential one. Moreover, We'll be in old-age technology then. Slow processing and computing will be done. Limited in fact very limited access. All the modern-day algos used in computers are inspiration from Turing Machines.

Roha Qureshi shared a link. February 12

In May 2017, a large ransomware attack called WannaCry (also known as WannaCrypt0r and WCry) hit NHS England and various organisations in the UK and around the world.

The attack was due to vulnerabilities found in Microsoft operating systems installed in millions of computers around the world.

According to Microsoft, the Windows versions that were vulnerable to the attack were versions which were no longer supported by Microsoft such as Windows 8 and Windows XP, which the NHS trusts and affected companies seemed to be running.

What Happened to My Computer?
Your important files are encrypted. Many of your documents, photos, videos, databases and other files are no longer accessible because they have been encrypted. Maybe you are busy looking for a way to recover your files, but do not waste your time. Nobody can recover your files without our decryption service.

Payment will be raised on
5/16/2017 00:47:55
Time Left
02:23:57:37

Can I Recover My Files?
Sure. We guarantee that you can recover all your files safely and easily. But you have not so enough time. You can decrypt some of your files for free. Try now by clicking <Decrypt>. But if you want to decrypt all your files, you need to pay. You only have 3 days to submit the payment. After that the price will be doubled. Also, if you don't pay in 7 days, you won't be able to recover your files forever. We will have free events for users who are so poor that they couldn't pay in 6 months.

How Do I Pay?
Payment is accepted in Bitcoin only. For more information, click <About bitcoin>. Please check the current price of Bitcoin and buy some bitcoins. For more information, click <How to buy bitcoins>. And send the correct amount to the address specified in this window. After your payment, click <Check Payment>. Best time to check: 9:00am - 11:00am

A BIG BIG LOSS !!!

The Internal Revenue Service has never been an organization to turn down money, except in one now-famous instance in 2006 where it trusted a computer program to call out potential fraud cases in returns claiming refunds. The tax collection agency wasn't aware their program was inoperative until it was too late, costing what the Associated Press via the Houston Chronicle estimates was between \$200 million and \$300 million in revenue. But that's okay. We'... [See More](#)

The morris worm!

A program developed by a Cornell University student for what he said was supposed to be a harmless experiment wound up spreading wildly and crashing thousands of computers in 1988 because of a coding error. It was the first widespread worm attack on the fledgling Internet. The graduate student, Robert Tappan Morris, was convicted of a criminal hacking offense and fined \$10,000. Morris's lawyer claimed at the trial that his client's program helped improve computer security. Costs for cleaning up the mess may have gone as high as \$100 Million. Morris, who interestingly co-founded the startup incubator Y Combinator, is now a professor at the Massachusetts Institute of Technology. A disk with the worm's source code is now housed at the University of Boston.

"The most expensive hyphen in history"

In 1962 the Mariner 1 rocket with a space probe was designed for a planetary flyby of Venus at a cost of \$18.5 million. Shortly after takeoff the rocket responded improperly to commands from the guidance systems on the ground & diverted from its intended flight path. With the craft effectively uncontrolled, a range safety officer ordered its destructive abort 294.5 seconds after launch

The launch was aborted due to a combination of two failures.

First, the guidance antenna on the Mariner performed poorly & below specifications. This caused a loss of contact with the ground guidance system.

The rocket's guidance system had an on-board program that could be activated in the event that the ground signal was lost, but it contained a faulty equation. A programmer incorrectly transcribed a handwritten formula into computer code, missing a single superscript bar. Without the smoothing function indicated by the bar, the software treated normal variations of velocity as if they were serious, causing exaggerated corrections that sent the rocket off course

NHS Software Glitch:

In 2016, NHS, England's national healthcare system admitted to mis-prescribing medication to over 300,000 heart patients due to a software glitch. The software "SystemOne", that was used to calculate the risk of a heart attack, had been reported to produce inconsistent results since 2009, summing up to a period of approximately 8 years of incorrect prescription to heart patients. Owing to this, patients with little risk of heart disease may have been needle... [See More](#)

UP to 300,000 heart patients may have been given the wrong drugs

The long-running error – uncovered by Pulse magazine – may have led to some patients being wrongly advised they did not need statins – and later suffering heart...

FLIGHT CRASHES:

In 1994 in Scotland, a Chinook helicopter crashed and killed all 29 passengers. While initially the pilot was blamed for the crash, that decision was later overturned since there was evidence that a systems error had been the actual cause.

Another example of a software-induced flight crash happened in 1993, when an error in the flight-control software for the Swedish JAS 39 Gripen fighter aircraft was behind a widely publicized crash in Sweden.... [See More](#)
